# 1 Part 1

To find a model of the system we started with Newton's 2nd law for rotation, which states that

$$\sum \tau = J\alpha \quad (1)$$

where  $\tau$  is the external torque,  $J$  is the moment of inertia, and  $\alpha$  is the angular acceleration. Using this for each of the three axis gives

$$J_p \ddot{p} = L_1 V_d \quad (2a)$$

$$J_e \ddot{e} = L_2 \cos(e) + L_3 V_s \cos(p) \quad (2b)$$

$$J_\lambda \ddot{\lambda} = L_4 V_s \cos(e) \sin(p) \quad (2c)$$

where

$$L_1 = K_f l_p$$

$$L_2 = (m_c l_c - 2m_p l_h)g$$

$$L_3 = K_f l_h$$

As the model in eq. (2) is non-linear we need to linearize the model to be able to design a linear controller. To do this we need a point to linearize around. For this we use  $(p^*, e^*, \lambda^*)^T = (0, 0, 0)^T$ . We also need to find the voltages  $V_s^*$  and  $V_d^*$  that makes  $(p^*, e^*, \lambda^*)^T$  an equilibrium. Setting eq. (2a) and eq. (2b) to zero gives

$$V_d^* = 0$$

$$V_s^* = -\frac{L_2}{L_3}$$

The next thing we did was a coordinate transform, to simplify the model of the system. The new states are  $(\tilde{p}, \tilde{e}, \tilde{\lambda})^T = (p, e, \lambda)^T - (p^*, e^*, \lambda^*)^T$  and the new inputs are  $(\tilde{V}_s, \tilde{V}_d)^T = (V_s, V_d)^T - (V_s^*, V_d^*)^T$ . This gives the system

$$\ddot{\tilde{p}} = \frac{L_1}{J_p} \tilde{V}_d \quad (5a)$$

$$\ddot{\tilde{e}} = \frac{L_2}{J_e} \cos \tilde{e} + (L_3 \tilde{V}_s - L_2) \cos \tilde{p} \quad (5b)$$

$$\ddot{\tilde{\lambda}} = \quad (5c)$$

Now that the system is on a nice form, we can linearize it. This gives us a system on the form  $\dot{\mathbf{x}} = \mathbf{A}\mathbf{x} + \mathbf{B}\mathbf{u}$ , where the matrices is given by

$$\mathbf{A} = \begin{bmatrix} \frac{\partial \ddot{p}}{\partial p} = 0 & \frac{\partial \ddot{p}}{\partial e} = 0 & \frac{\partial \ddot{p}}{\partial \lambda} = 0 \\ \frac{\partial \ddot{e}}{\partial p} = 0 & \frac{\partial \ddot{e}}{\partial e} = 0 & \frac{\partial \ddot{e}}{\partial \lambda} = 0 \\ \frac{\partial \ddot{\lambda}}{\partial p} = -\frac{L_2}{J_\lambda} & \frac{\partial \ddot{\lambda}}{\partial e} = 0 & \frac{\partial \ddot{\lambda}}{\partial \lambda} = 0 \end{bmatrix} \quad (6a)$$

$$\mathbf{B} = \begin{bmatrix} \frac{\partial \ddot{p}}{\partial \tilde{V}_s} = 0 & \frac{\partial \ddot{p}}{\partial \tilde{V}_d} = \frac{L_1}{J_p} \\ \frac{\partial \ddot{e}}{\partial \tilde{V}_s} = \frac{L_3}{J_e} & \frac{\partial \ddot{e}}{\partial \tilde{V}_d} = 0 \\ \frac{\partial \ddot{\lambda}}{\partial \tilde{V}_s} = 0 & \frac{\partial \ddot{\lambda}}{\partial \tilde{V}_d} = 0 \end{bmatrix} \quad (6b)$$

Writing out eq. (6) we get

$$\ddot{p} = \frac{L_1}{J_p} \tilde{V}_d = K_1 \tilde{V}_d \quad (7a)$$

$$\ddot{e} = \frac{L_3}{J_e} \tilde{V}_s = K_2 \tilde{V}_s \quad (7b)$$

$$\ddot{\lambda} = -\frac{L_2}{J_\lambda} \tilde{p} = K_3 \tilde{p} \quad (7c)$$

## 2 Part 2: Monovariabe Control

### 2.1 Problem 1

#### 2.1.1 Controllability

We look at the controllability matrix:
